

The National Innovation Foundation–India (NIF) conducted extensive field visits across the districts of Kulgam, Anantnag, Budgam, Bandipora, and Baramulla to undertake detailed documentation and verification of unique veterinary and plant protection practices. These efforts are aimed at facilitating further validation, field trials, and potential patent filing.

During the outreach, several new and promising grassroots practices were also identified across the domains of engineering, plant protection, and veterinary sciences. The findings underscore the richness of local knowledge systems and highlight their significant potential for broader application and technological development.
